Introduction

Instructor: Michael Heinz

Email: michael_heinz@berkeley.edu (Do NOT use bCourses mail) Office hours: Tu/Th 2-3:30 PM, 1044 Evans Hall (starting 08/30) Website: https://mheinz757.github.io/teaching/math-98-fa22/

• Per Section 102.23: Course Materials of the UC Berkeley Student Code of Conduct - don't post any of these materials to CourseHero (or any similar sites)

Lab Computer Login: !cmfmath98 Password: c@1b3arsaddition

Lectures, Grading and Deliverables

- 4 Lectures
 - Every Tu/Th, starting Tues (08/30)
- 4 Homeworks
 - ▶ Due Tu/Th at 11:59pm, 7 days after corresponding lecture
 - Graded largely on effort and completion
 - Assignment Submission: on bCourses
 - ★ Solutions appear 1 hour after deadline
 - Can be somewhat flexible with deadlines (within reason)
 - ★ But in your best interest to complete course quickly
- I Project
 - Graded for accuracy
 - Expectation is that you get this *completely* correct as warmup for 128a PAs
- Receiving a P in this class should not be hard
 - Each HW worth 15 points, Project worth 40
 - Must receive minimum of 70% average on the HW assignments and 70% on the project
 - Start early, work hard, and seek help on the assignments

Who should take this course

- If you have no/minimal programming experience:
 - This is the target audience of this course
 - We will build things up from scratch
 - I also expect many of you to also feel a bit nervous about programming (and that's OK!)
- If you have extensive programming experience in another language:
 - This course likely won't be a good use of your time
 - Easy to pick up MATLAB syntax yourself. Work through an online tutorial (see suggestions on my webpage)
- Is For everyone else in between.....
 - Take a look at some of the homeworks and see if you could mostly code them up in another language

To everyone: You may find it more efficient to learn yourself once you've gotten started. Everyone is highly encouraged to read/study ahead.

(4 回) (4 \Pi) (4 \Pi)

Why you should take this course

Why take this course? (vs. some other course)

- Ondensed focus that covers the necessary material for Math 128a
- Assignments that are well aligned with Math 128a
 - Especially the final project
- Availability of customized help (from me!) in office hours
 - Even if you can figure out the problem, it is extremely useful to get feedback on your thought process and areas for improvement. So make sure to ask for it!

There is no real need to formally enroll for 1 unit (unless you want it). I will be happy to grant access to the course material to auditors and speak with them in office hours.

過 ト イヨ ト イヨト

Plan: Spend 50-60 minutes lecturing (depends on the day) and do lots of exercises

- Have MATLAB open to experiment and try things out
- Will stop for many in class exercises, and I will go around and offer help

A B F A B F

Course Expectations

This is a fairly intense course. In 2 weeks you will go from no programming experience to being able to complete a 128A Programming Assignment.

What you should do:

- $\bullet\,$ Try to set aside a block of ${\sim}2{\text{-}3}$ hours at least every other day to practice programming (including the lectures)
 - Like taking a foreign language class. <u>Immersion</u>
- Interrupt me as frequently as needed for clarification and questions
- Talk to neighbors (at a respectful volume) and ask for help
- Important: Actually try to figure things out and stay to work on the exercises
- More Important: <u>Practice.</u> The best way to learn how to code is to <u>write lots of code.</u>

I would like to acknolwedge the instructor of this course for the previous five semesters, Andrew Shi. The slides, assignments, and webpage are largely adapted from his materials: https://math.berkeley.edu/~andrewshi/math98/sp22/98-sp22.html.

Thanks Andrew!

< 回 ト < 三 ト < 三 ト

Agenda

- Go over items on the course webpage
- MATLAB Introduction
- Variables and Formatting
- Vectors and Matrices
- Scripts
- Exercises

э

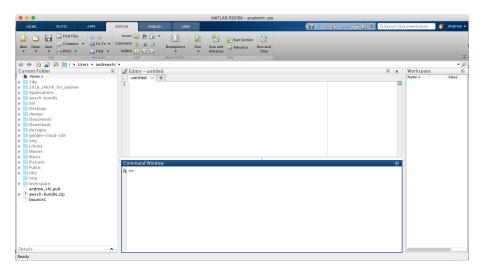

- ∢ ∃ ▶

Downloading MATLAB

- MATLAB is available for free for UC Berkeley students via a campus license
- Make sure to download ASAP in case issues arise

MATLAB Intro: Getting started with MATLAB

Matlab has five features:

- Current Folder shows the files that MATLAB is accessing. By default MATLAB cannot execute files contained in other folders.
- Command Window Here we can define variables, perform calculations, and much more.
- Workspace is a MAT-file containing the variables you have defined in your session.
- **Objection** Blows us to save collections of commands as M-files.
- **Sommand History** can be accessed using the up arrow.

It's OK if this doesn't make much sense yet we will revisit this.

MATLAB Intro: Reset Layout

If something happens to this, you can reset the layout to the default configuration.

Math 98, Fall 2022

MATLAB Intro: Command Window

To begin with, think of MATLAB as a giant calculator. **Operations:** $+, -, *, /, \hat{\cdot}, \exp(\cdot), \sqrt{\cdot}, \log(\cdot)$

>> 2 - 3*(1+2)/2 ans = -2.5000>> 3^4 ans =81 >> log(4)ans =1.3863 >> sqrt(9.01) ans =3.0017

イロト 不得下 イヨト イヨト

MATLAB Intro: Help

Wait, what kind of logarithm is that?

```
>> help log
log Natural logarithm.
log(X) is the natural logarithm of the elements of X.
Complex results are produced if X is not positive.
See also log1p, log2, log10, exp, logm, reallog.
```

Reference page for log Other functions named log

help is going to be your best friend when using MATLAB.

MATLAB Intro: MATLAB Documentation

- The online documentation is also excellent with many examples.
- Google search "matlab log"
 - https://www.mathworks.com/help/matlab/ref/log.html
- Knowing where to find the answer is much more important than knowing the answer.

MATLAB Intro: Built-in MATLAB Functions

• Many built in functions in MATLAB to do math.

cos(x)	Cosine	abs(x)	Absolute value
sin(x)	Sine	sign(x)	Signum function
tan(x)	Tangent	max(x)	Maximum value
acos(x) asin(x) atan(x) exp(x) sqrt(x) log(x) log10(x)	Arc cosine Arc sine Arc tangent Exponential Square root Natural logarithm Common logarithm	<pre>max(x) min(x) ceil(x) floor(x) round(x) rem(x) angle(x) conj(x)</pre>	Maximum value Minimum value Round towards $+\infty$ Round towards $-\infty$ Round to nearest integer Remainder after division Phase angle Complex conjugate

3

(日) (周) (三) (三)

Variables: ans

The workspace shows variables that have been defined in the current session. In particular, ans is by default the value of the last arithmetic computation we made. We can check the value of a variable by entering its name in the command window.

>> 1 + 3 ans =4 >> ans ans = 4 >> 3 * 8 ans = 24 >> ans ans =24

Math 98, Fall 2022

Variables: Defining Your Own

We can define our own variables, too! Variable names must start with a letter and can contain letters, digits, and underscores. MATLAB is case sensitive but all built-in MATLAB functions use lowercase letters, so if you use at least one capital letter in your variable names you can be sure to avoid any name conflicts.

```
>> x1 = 5.337
>> my_variable = ``howdy"
>> frodoBaggins33 = sqrt(2)*pi
>> x2 = x1 + 1
```

Variables: Built-in Variables I

There are many built in variables too.

>> pi ans = 3.1416 >> eps ans = 2.2204e-16

You can override these if you want....

>> pi = 4 >> pi pi = 4

.....but this is usually a bad idea. Try to avoid ambiguity.

A B F A B F

Variables: Built-in Variables II

There are two more special built in variables: Inf and NaN (not a number)

>> 1/0 ans =Inf >> -1/0 ans =-Inf >> 0/0 ans = NaN >> Inf/Inf ans =NaN

What is Inf/0? What about exp(exp(7))? Compare to exp(exp(6)).

Variables: Using Informative Names

Give your variables informative names. Good.

```
>> radius = 4
>> area = pi*radius^2
area =
50.2655
Bad.
>> foo = 4
>> blah = pi*foo^2
blah =
50.2655
```

3

A B M A B M

Variables: Suppresing Output

Use a semicolon to suppress the output of a command. Using disp will suppress the ans = text, but will also not save the output to ans. Multiple commands can be placed on a line separated by semicolons.

```
>> x = 5; y = 6; disp(x+y)
11
```

Use SHIFT-ENTER to start a new line. Use ellipses (\dots) and SHIFT-ENTER to continue a line.

```
>> sqrt(5 + 7 + ...
13)
ans =
5
```

Use clear to clear all variables from the workspace. Use clear VAR1 VAR2 to clear specific variables VAR1 and VAR2.

>> x = 5; clear x;
>> x
Undefined function or variable 'x'.

Use **clc** to clear the command line.

Formatting: long and short

Doesn't pi have more digits than this?

>>	pi
an	s =
З.	1416

This is just a formatting/visual thing. Try format long to show 15 digits.

>> format long pi ans = 3.141592653589793

Then try format short.

>>	format	short
pi		
ans	5 =	
3.1	L416	

Formatting: compact and loose

Go into MATLAB and do stuff in the command window. Do you notice all those blank lines in between the command window output? Experiment with format compact and format loose.

A B F A B F

Vectors: Introduction

In addition to strings and scalars, we can define variables that represent vectors.

```
>> v = [1, 5, -2];
>> y = [2; 3; 4; 10];
>> z = [-1 10 4];
>> max(v)
5
>> length(y)
4
```

We can do arithmetic with vectors and scalars, or with pairs of vectors. When working with pairs of vectors the symbols $*, /, \hat{}$ are reserved for matrix operations while element-wise operations use $.*, ./, \hat{}$ instead.

>> v + 2 3 7 0 >> v.^2 1 25 4

Vectors: Creating Them

If the elements of the vector follow a pattern then we may have some quick commands that define them. Try:

```
>> ones(1,5)
>> zeros(1,5)
>> rand(1,5)
>> 1:3:18
>> 16:-3:-5
>> linspace(0, 10, 7)
>> logspace(-1, 0, 5)
>> cos(pi*(0:1/6:2))
```

Vectors: Accessing Elements

Use the notation v(i) to look up the i-th element of the vector v. We can also change individual elements of v this way.

```
>> v = [1,3,5,8,10]; v(3)
5
>> v(3:5)
5 8 10
>> v(5:-1:1)
                    % same as fliplr(v)
10 8 5 3 1
>> w = [1,4,2]; v(w) % can you solve this one?
1 8 3
>> v = [v, 6]
1 3 5 8 10 6
>> v(3) = 2; v(9) = 7
                         % pad with zeros
1 3 2 8 10 6 0 0 7
```

Vectors: Vector Operations

```
>> w = [1; 3; 5; 7]; w = w';
1 3 5 7
>> w(2:end)
3 5 7
>> w(end+1) = 500
1 3 5 7 500
>> x = [1, 2; 3; 4]
Dimensions of arrays being concatenated are not consistent.
```

MATLAB = Matrix Laboratory

Matrices: like vectors, but with more dimensions?

>> ones(2, 3) 1 1 1 1 1 1 >> ones(2) 1 1 1 1

Try also:

- zeros(m,n)
- rand(m,n)
- randn(m,n)

What happens if you enter only m and leave out n? Read the documentation to confirm.

(B)

Matrices: Special Ways to Create Them

Other commands to create special types of matrices:

```
\rightarrow eye(2)
    1
        0
   0
     1
>> v = [3,5]; diag(v)
   3
        0
   0
     5
>> diag(v,-1) + 2*eye(3)
   2
        0
             0
   3 2 0
      5 2
   0
```

< 3 > < 3 >

Matrices: Build Your Own

To type a a matrix into MATLAB you must:

- Begin with a square bracket, [
- Separate Elements in a row with spaces or commas
- Use a semicolon ; to seperate rows
- End with another square bracket,]

э

(日) (同) (三) (三)

Matrices: Accessing Entries

Accessing entries of a matrix

```
>> A(2, 3) %row, column
ans =
8
>> A(6)
ans =
2
```

What does the second result suggest to you about how the entries in a matrix are indexed?

Matrices: Accessing Columns, Rows, and Submatrices

Accessing rows and columns of a matrix

>> A(:, 2) ans = 4 6 2 >> A(3, :) ans = 0 2 6

Accessing submatrices

>> A(2:3, 2:3) ans = 6 8 2 6

э

(日) (同) (日) (日) (日)

Matrices: Matrix Operations

As with vectors, we have lots of ways to access and manipulate the entries of matrices. Try out the following commands:

```
>> A = reshape(1:12,3,4)
>> size(A) % also size(A,1) and size(A,2)
>> A'
>> fliplr(A) % also flipud(A)
>> A(:,[1, 3])
>> p = randperm(3); q = randperm(4); A(p,q)
>> reshape(A,2,6)
>> A(3, 3) = 1
>> A(:, 2) = A(:, 1)
```

Type help [your command here] to learn more!

・ 伺 ト ・ ヨ ト ・ ヨ ト …

Matrices: Solving Ax = b

Two ways to solve Ax = b:

>> x = inv(A)*b >> x = A\b

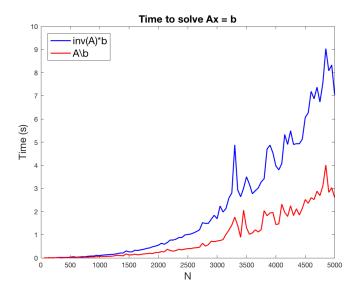

Which one should we use?

э

A B F A B F

- < A

Matrices: Solving Ax = b: Graph

38 / 43

2

(人間) トイヨト イヨト

Why Don't These Work?

It is also equally (if not more) informative to study things that don't work, since much of your time will be dealing with bugs and errors.

```
>> A = [1, 3, 5; 1, 2];
>> A = [1, 3, 5]; B = [1, 3];
A + B
>> A = eye(3);
A(0)
>> A = [1, 3, 5]
A<sup>2</sup>
```

Editor

Okay, it's finally time to make a proper script! In the command line, enter

>> edit Hello.m

 $\mathsf{Or}~\mathsf{New}\to\mathsf{Script}~(\mathsf{Top}~\mathsf{Left})$

- An m-file is a file containing a script for MATLAB—a sequence of instructions for the computer.
- The name of the file must have the format filename.m.
 - Filenames are case sensitive (like everything in MATLAB).
 - filename.m and Filename.m are different!
- For MATLAB to execute the file, it must be saved in the Current Directory.

Two ways to run a script:

- Open up the script and hit "Run".
- Type the name of the script into the Command Window.

input

Sometimes we want to be able to request input from the user.

```
>> input('Please input a starting value: ')
Please input a starting value:
```

Let's give it the number 3.

We should probably assign the input to a value.

Except within a string, everything following % is a comment. Comments do not get executed when the program runs, but can make the code easier to read by providing information about its organization and usage.

Comments in the beginning lines of a program will be revealed when using the command help.

help (as well as doc) is also invaluable when learning how to use various MATLAB functions.

A temperature can be converted from Fahrenheit to Celsius using the formula c = (5/9)(f - 32), where c is Celsius and f is Fahrenheit. Write a script that prompts the user for a temperature in Fahrenheit, converts it to Celsius, and prints it.
